

Class C Motorhome Chassis Handling Solutions

Porpoising, bouncing, harsh ride, and floating front end.

Solution: Upgrade to Bilstein HD Shock absorbers. This will improve ride quality and control.

Excessive body roll on winding roads and in windy conditions, passing trucks are blowing the coach around the road.

Solution: Install Front & Rear HD Sway Bar, for much better control and safer handling. This will reduce body-roll and sway of the vehicle.

It feels like the rear of the coach is moving sideways when a truck passes me, or on a windy day, and I am always over steering it.

Solution: Installing a TigerTrak™ rear track bar will stop the rear axle from shifting, and make the coach much easier to handle.

I am concerned about a Front tire blowout.

Solution: A TruCenter™ Steering Control will hold you in a straight ahead position, even with a front tire blowout.

I have to keep both hands on the steering wheel, even on good roads, with no wind.

Solution: A TruCenter™ Steering Control will hold the tie-rod with up to 135 lbs of pressure. This will make your vehicle go straighter without constant steering wheel correction. It will be much easier to drive with less fatigue, and all front-end parts, and tires will last longer.
