

Ford F-53 Motorhome Equipped Chassis Handling Solutions

Porpoising, bouncing, harsh ride, and floating front end.

Solution: Upgrade to Bilstein HD Shock absorbers. This will improve ride quality and control.

Excessive body rolls on winding roads and in windy conditions, passing trucks blowing your coach around the road.

Solution: Install Front & Rear HD Sway Bar, for much better control and safer handling. This will reduce body-roll and sway of the vehicle.

**Steering wander or rut tracking due to front and rear axles shifting side to side!
The front and back ends feel like they are moving sideways.**

Solution: Front and Rear TigerTrak™ track bars eliminates the axels shifting, resulting in a much better handling coach. No more tail wag or over steering.

I am concerned about a Front tire blowout.

Solution: A TruCenter™ Steering Control will hold you in a straight ahead position, even with a front tire blowout.

I always have to steer into a side wind, or crowned roads. It wears me out!

Solution: With the push of a button mounted on the dash, a TruCenter™ Steering Control will Re-center itself to compensate for side winds or crowned roads. This feature makes driving in winds a whole lot easier.

I have to keep both hands on the steering wheel, even on good roads, with no wind.

Solution: A TruCenter™ Steering Control will hold the tie-rod with up to 160 lbs of pressure. This will make your vehicle go straighter without constant steering wheel correction. It will be much easier to drive with less fatigue, and all front-end parts, and tires will last longer.
